

CONSUMER PURCHASE INTENTION TOWARD TRADITIONAL CHIPS IN LOCAL SUPERMARKETS
IN JAKARTA: MARKETING STRATEGY IMPLICATIONS FOR PT SARI RASA

Consumer Marketing & Distribution Research

What Makes Consumers Buy Traditional Chips?

*Evidence from Local Supermarkets in Jakarta and Marketing Strategy Implications for
PT Sari Rasa*

Article Classification: Empirical Research Paper

Fields: Consumer Behavior · Marketing Strategy · Retail Distribution

July, 2026

Highlights

- Price, product quality, and availability significantly drive purchase intention (Adj. $R^2 = 82.0\%$).
- Price is the strongest predictor ($\beta = 0.436$), reflecting affordability rather than raw cost.
- Product availability ($\beta = 0.331$) is the most actionable lever for a distributor.
- Packaging and lifestyle show no significant individual effect on purchase intention.
- PESTEL–SWOT integration translates findings into prioritized strategy for PT Sari Rasa.

Abstract

Traditional chips remain an important category within Indonesia's traditional snack market, but increasing competition from contemporary packaged snacks, imported products, and supermarket private-label products has increased the need for businesses to understand the factors influencing consumer purchase intention. This study investigates consumer purchase intention toward traditional chips sold in local supermarkets in Jakarta and develops marketing strategy implications for PT Sari Rasa, a distributor of traditional chip products.

A quantitative research approach was employed using a survey of 100 respondents who had previously purchased traditional chips from local supermarkets in Jakarta. Six potential determinants were initially examined: price, product quality, packaging, promotion, lifestyle, and product availability. Data were analyzed using descriptive analysis, Principal Component Analysis (PCA), and multiple linear regression. The promotion construct was excluded from regression analysis because it did not satisfy the required validity, reliability, and factor analysis criteria.

The regression results indicate that price, product quality, and product availability have positive and statistically significant effects on purchase intention, with price representing the strongest determinant ($\beta = 0.436$), followed by product availability ($\beta = 0.331$) and product quality ($\beta = 0.206$). Packaging and lifestyle did not demonstrate statistically significant individual effects. The model was statistically significant overall and explained 82.0% of the variation in purchase intention based on the adjusted R^2 . PESTEL and SWOT analyses were subsequently used to translate the empirical findings into strategic implications for PT Sari Rasa. The recommended strategic priorities emphasize value-for-money positioning, wider supermarket coverage, broader product assortment, consistent stock availability, and maintenance of product quality.

Keywords: *traditional chips; purchase intention; consumer behavior; principal component analysis; marketing strategy; SWOT; PESTEL*

1. Introduction

Micro, small, and medium-sized enterprises (MSMEs) play an important role in the Indonesian economy and represent the majority of business units in the country. The food and beverage sector constitutes one of the important areas of MSME activity, supported by changing lifestyles, household consumption, and consumer demand for convenient food products. Within this environment, traditional snacks represent an important category because of their cultural relevance, product diversity, and availability through both traditional and contemporary retail channels.

Traditional chips are among the products that continue to benefit from consumer familiarity with Indonesian snacks. However, the increasing availability of packaged snack alternatives has intensified competition. Consumers can choose between traditional chips, contemporary potato and extruded snacks, biscuits, imported products, and supermarket private-label products. Consequently, traditional snack businesses must compete not only through product quality but also through price, packaging, availability, and marketing activities.

The retail environment is particularly relevant because local supermarkets provide consumers with direct access to packaged snack products. Physical retail allows consumers to evaluate products based on their availability, appearance, packaging, and perceived value before purchase. PT Sari Rasa operates within this environment as a distributor and trading company that connects traditional chip suppliers with local supermarket retailers in Jakarta. Rather than manufacturing the products itself, PT Sari Rasa contributes primarily through distribution and product availability.

This creates an important managerial question. Although increasing distribution can make traditional chips more accessible, product availability alone does not necessarily guarantee consumer purchase. Consumers evaluate multiple product attributes before deciding whether to purchase. Understanding which attributes actually influence purchase intention is therefore important for determining where managerial resources should be concentrated.

Purchase intention represents consumers' willingness or propensity to purchase a product. Within the Theory of Planned Behavior (TPB), behavioral intention is influenced by attitudes, subjective norms, and perceived behavioral control. Consumer Behavior Theory further explains that purchasing decisions are shaped by psychological, social, personal, and cultural factors. These perspectives provide a theoretical foundation for examining how consumers evaluate traditional chips and subsequently develop purchase intentions.

Based on the literature review, six potential factors were identified: price, product quality, packaging, promotion, lifestyle, and product availability. These factors represent different aspects of the consumer decision-making process and the marketing mix. Product quality and packaging represent product-related considerations, price represents monetary value, promotion represents marketing communication, lifestyle represents consumer characteristics, and product availability represents the retail and distribution environment.

However, previous research does not necessarily provide a consistent explanation of which factors are most important in the context of traditional chips sold through local supermarkets. Furthermore, managerial implications for distributors may differ from those for manufacturers because distributors have greater control over distribution, assortment, retailer relationships, and availability than over product formulation or packaging development.

Therefore, this study addresses two research questions:

1. What factors influence consumer purchase intention toward traditional chips sold in local supermarkets in Jakarta?
2. What marketing strategies can be recommended for PT Sari Rasa to increase consumer purchase intention toward traditional chips sold in local supermarkets in Jakarta?

The study contributes by connecting consumer-level empirical evidence with a strategic analysis of PT Sari Rasa. Quantitative findings are integrated with PESTEL and SWOT analyses to translate consumer insights into practical marketing strategy implications.

2. Literature Review

2.1 Consumer Behavior Theory

Consumer Behavior Theory explains how individuals select, evaluate, and purchase products to satisfy their needs. Consumers do not necessarily respond to the same marketing stimuli in the same manner because their evaluations are influenced by expectations, experiences, personal characteristics, and social and cultural contexts.

Kotler and Keller (2016) identify cultural, social, personal, and psychological factors as important influences on consumer behavior. Schiffman and Wisenblit (2015) similarly emphasize that consumers process information based on individual expectations and experiences.

Within the context of traditional chips, consumer evaluations may therefore differ even when consumers are exposed to the same products in the same supermarket environment. Price, quality, packaging, promotion, lifestyle, and availability represent external and internal considerations that may contribute to the formation of purchase intention.

2.2 Theory of Planned Behavior

Ajzen's (1991) Theory of Planned Behavior explains behavioral intention through three major determinants: attitude toward the behavior, subjective norms, and perceived behavioral control. Behavioral intention subsequently represents the immediate determinant of actual behavior.

In the context of traditional chips, consumers may develop stronger purchase intentions when they have positive evaluations of the product, perceive purchasing it as feasible, and experience relevant social influences.

Product availability is particularly relevant to perceived behavioral control because consumers cannot purchase products that are unavailable or difficult to obtain. Similarly, price can influence consumers' perceptions of whether purchasing the product is reasonable or feasible.

TPB therefore provides a theoretical foundation for understanding purchase intention as an outcome of consumer evaluations and perceived purchasing conditions.

2.3 Marketing Mix

The marketing mix, as formalized by Kotler and Armstrong (2018), consists of Product, Price, Place, and Promotion. These elements represent controllable marketing activities that organizations can use to create customer value and influence consumer decision-making. In this research, Product is represented by product quality and packaging; Price represents consumers' evaluation of monetary value; Place is represented by product availability; and Promotion represents marketing communication activities.

This framework provides the theoretical justification for examining the selected marketing variables as potential determinants of purchase intention.

2.4 Product Quality

Product quality represents consumers' evaluation of the characteristics and performance of a product. For food products, sensory characteristics such as taste and texture are particularly relevant because consumers can directly experience them. In this study, product quality was measured through indicators covering taste, ingredients, texture, hygiene, perceived quality, and satisfaction. The six indicators were designed to capture consumers' overall evaluation of traditional chip quality.

2.5 Packaging

Packaging serves both functional and communication purposes (Rundh, 2005). It protects the product while simultaneously providing information and contributing to consumers' perceptions of product quality. Packaging may influence purchase decisions through visual attractiveness, information clarity, practicality, product protection, perceived quality, and purchase attraction (Silayoi & Speece, 2007). These dimensions were incorporated into the six packaging indicators used in this study.

2.6 Promotion

Promotion represents marketing communication activities intended to inform, persuade, and remind consumers about products (Belch & Belch, 2018). Promotional activities may include discounts, promotional displays, product information, and other communication mechanisms.

Promotion was initially included as an independent variable. However, the construct subsequently failed the measurement requirements and was therefore excluded from regression

analysis. This distinction is important: the exclusion does not demonstrate that promotion has no effect on purchase intention. Rather, the study was unable to empirically test the relationship because the measurement instrument did not adequately capture the promotion construct.

2.7 Lifestyle

Lifestyle describes how individuals spend their time and resources and how their activities, interests, and opinions influence consumption behavior. The study applies Plummer's (1974) Activities, Interests, and Opinions (AIO) perspective to examine lifestyle-related characteristics associated with traditional snack consumption. Lifestyle was measured through consumers' preference for traditional snacks, interest in product variety, snacking habits, preference for convenience, orientation toward local products, and compatibility between traditional chips and their lifestyle.

2.8 Product Availability

Product availability refers to consumers' ability to find and obtain products when they want to purchase them (Berman & Evans, 2018). In a supermarket environment, availability includes not only whether a product exists in an outlet but also whether consumers can easily locate it, whether sufficient stock is maintained, and whether sufficient product variety is provided. The study measured product availability through product visibility, product variety, shelf arrangement, stock availability, distribution coverage, and inventory consistency.

2.9 Purchase Intention

Purchase intention represents the consumer's propensity and willingness to purchase a product. It was measured through six indicators covering purchase interest, desire, future consideration, willingness to purchase when available, preference over similar products, and intention to purchase again. Purchase intention therefore represents the dependent variable through which the effects of the selected consumer and marketing factors were examined.

3. Research Methodology

3.1 Research Design

This research employed a quantitative approach using a structured questionnaire, following Sugiyono's (2019) guidelines for quantitative survey research. The study focused on consumers who had previous experience purchasing traditional chips from local supermarkets in Jakarta. The research framework initially proposed six independent variables: Price (X1), Product Quality (X2), Packaging (X3), Promotion (X4), Lifestyle (X5), and Product Availability (X6). Purchase Intention (Y) was used as the dependent variable.

3.2 Population and Sample

The population consisted of consumers in Jakarta who had purchased traditional chips from local supermarkets. Purposive sampling was employed because respondents needed to satisfy specific criteria relevant to the research objective. A total of 100 valid respondents participated in the study.

The questionnaire used a five-point Likert scale ranging from 1 = Strongly Disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, to 5 = Strongly Agree.

3.3 Research Instrument

Each construct was measured using six indicators. The questionnaire contained 42 measurement items across the seven initial constructs. The research instrument was developed by adapting theoretical concepts and previous empirical research to the specific context of traditional chips in Jakarta supermarkets, following Sugiyono's (2019) guidance on quantitative survey design.

Table 1. *Measurement Indicators by Construct*

Variable	Indicators
Price	Affordability, price-quality fit, competitiveness, price acceptance, willingness to pay, value
Product Quality	Taste, ingredients, texture, hygiene, expectations, satisfaction
Packaging	Visual appeal, information clarity, practicality, protection, perceived quality, purchase attraction

Variable	Indicators
Promotion	Exposure, attractiveness, information availability, display, awareness, effectiveness
Lifestyle	Product preference, variety seeking, snacking habits, practicality, local orientation, lifestyle compatibility
Product Availability	Visibility, variety, shelf arrangement, stock availability, distribution coverage, stock consistency
Purchase Intention	Interest, desire, future consideration, willingness, preference, repurchase intention

Note. Indicators were adapted from established consumer-behavior and marketing-mix literature (see Section 2) to the traditional-chips retail context.

The operationalization was based on consumer behavior theory, marketing mix theory, retailing theory, TPB, and previous empirical studies.

3.4 Data Analysis

The data were analyzed through several stages:

3. Descriptive analysis
4. Validity testing
5. Reliability testing
6. Sample adequacy testing
7. Principal Component Analysis
8. Classical assumption testing
9. Multiple linear regression
10. Hypothesis testing
11. PESTEL analysis
12. SWOT analysis

PCA was used as a data reduction technique to generate representative factor scores from the measurement indicators. These factor scores were subsequently used in the multiple linear regression analysis. PCA itself was not used to determine causal significance; statistical significance was assessed through regression analysis.

4. Results

4.1 Respondent Characteristics

The sample consisted of 100 respondents. Female respondents represented 51% of the sample, while male respondents represented 49%. The largest age group was respondents aged 21–30 years, representing 40%.

Bachelor's degree holders constituted the largest educational group at 45%. Office workers represented the largest occupational category at 49%. The largest income group earned between Rp5,000,000 and Rp7,499,999 per month, representing 29% of respondents.

Overall, the sample was characterized primarily by economically active respondents with relatively high educational attainment and moderate-to-higher income levels.

4.2 Descriptive Analysis

The descriptive analysis showed generally positive consumer perceptions of traditional chips.

Table 2. *Descriptive Statistics of Study Variables (Mean Scores, N = 100)*

Variable	Mean
Price	3.584
Product Quality	4.157
Packaging	3.571
Promotion	3.213
Lifestyle	3.850
Product Availability	4.170
Purchase Intention	3.990

Note. Five-point Likert scale (1 = Strongly Disagree, 5 = Strongly Agree).

Product availability received the highest mean score among the examined marketing factors, followed closely by product quality. Promotion received the lowest mean score. These findings indicate that consumers generally perceived traditional chips positively in terms of quality and

availability, while promotional activity was perceived less favorably. However, descriptive statistics alone cannot establish whether a variable significantly influences purchase intention.

4.3 Principal Component Analysis

PCA was conducted to determine whether the indicators within each construct could be represented by a single underlying component. The analysis confirmed a unidimensional structure for the constructs retained for regression analysis. The strongest factor loadings were:

Table 3. *Principal Component Analysis — Strongest Factor Loading by Construct*

Construct	Strongest Indicator	Loading
Price	HG4	0.812
Product Quality	K3	0.800
Packaging	P6	0.708
Lifestyle	G2	0.764
Product Availability	A2	0.799
Purchase Intention	M2	0.826

Note. Loadings are for the single retained component per construct; the Promotion construct is excluded (see Section 4.4).

The strongest Price indicator was HG4, relating to affordability or the extent to which price represents a barrier to purchase. For Product Quality, K3 — relating to texture — was the strongest indicator. For Product Availability, A2 — product variety — was the strongest indicator.

These results provide additional consumer insight beyond the regression coefficients. Consumers' perceptions of price were particularly associated with affordability, while product quality was strongly represented by sensory characteristics. Product availability was strongly represented by variety.

4.4 Exclusion of Promotion

Promotion was excluded from subsequent regression analysis because it failed to satisfy the required measurement criteria. The construct had:

- Corrected Item-Total Correlation: 0.016–0.298

- Cronbach's Alpha: 0.305
- Bartlett's significance: 0.169
- Communalities: 0.008–0.487
- Total variance explained: 24.320%

Most importantly, the Bartlett's Test of Sphericity was not significant, indicating insufficient correlations among the promotion indicators to support factor extraction. Consequently, promotion was removed from PCA factor-score regression, hypothesis testing, and classical assumption testing.

This should not be interpreted as evidence that promotion does not influence purchase intention. Instead, the relationship could not be evaluated because the measurement instrument did not adequately represent the construct.

4.5 Classical Assumption Tests

The regression residuals satisfied the normality assumption. The Kolmogorov-Smirnov significance value was 0.081, while the Shapiro-Wilk significance value was 0.297.

No multicollinearity was detected. Tolerance values ranged from 0.224 to 0.556 and VIF values ranged from 1.798 to 4.472.

However, the Glejser test indicated heteroscedasticity for Price and Lifestyle. Price produced a significance value of 0.006 and Lifestyle produced 0.021.

Therefore, although the model satisfies normality and multicollinearity assumptions, the regression results should be interpreted with caution because the homoscedasticity assumption was not fully satisfied.

4.6 Multiple Linear Regression

The final regression model included five independent variables: Price, Product Quality, Packaging, Lifestyle, and Product Availability.

The model produced an R^2 of 0.829 and an Adjusted R^2 of 0.820. Thus, the five variables jointly explained 82.0% of the variation in purchase intention after adjustment for the number of predictors.

The ANOVA results showed $F = 92.261$, $p < 0.001$. Therefore, the regression model was statistically significant overall.

Table 4. *Multiple Linear Regression Results (Dependent Variable: Purchase Intention)*

Variable	β / B	t	Sig.	Result
Price	0.436	7.669	<0.001	Significant
Product Quality	0.206	2.296	0.024	Significant
Packaging	0.060	1.009	0.315	Not significant
Lifestyle	0.016	0.183	0.855	Not significant
Product Availability	0.331	4.342	<0.001	Significant

Note. $R^2 = 0.829$, Adjusted $R^2 = 0.820$, $F(5, 94) = 92.261$, $p < .001$. Significance threshold: $p < .05$.

4.7 Discussion of Regression Findings

4.7.1 Price and Purchase Intention

Price was the strongest determinant of purchase intention, with a coefficient of 0.436 and significance below 0.001.

The PCA findings provide an important interpretation of this relationship. The strongest Price indicator was HG4, representing the extent to which price is perceived as a barrier to purchase, with a factor loading of 0.812.

This suggests that consumers are particularly responsive to whether the price of traditional chips is perceived as reasonable and acceptable. The finding therefore concerns not simply the numerical price but consumers' perception of whether the price provides appropriate value.

For PT Sari Rasa, this implies that pricing strategy should focus on value-for-money positioning rather than indiscriminate discounting. Because PT Sari Rasa operates as a distributor and has limited control over supplier pricing, continuously lowering prices may not be sustainable. Instead, the company can strengthen consumers' perception of value through competitive shelf pricing, monitoring comparable products, communicating product benefits, and negotiating with suppliers and retailers.

4.7.2 Product Quality and Purchase Intention

Product quality also had a positive and statistically significant effect on purchase intention ($\beta = 0.206$; $p = 0.024$).

The strongest PCA loading for Product Quality was K3, relating to product texture, with a loading of 0.800. This indicates that sensory characteristics represent an important dimension of consumers' perceptions of traditional chip quality.

The finding suggests that consumers are more likely to purchase traditional chips when they perceive the products as meeting expectations for taste, texture, hygiene, and overall quality.

For PT Sari Rasa, however, product quality already received a high descriptive score. Consequently, the strategic implication is not necessarily aggressive quality improvement but quality maintenance and consistency, achieved through supplier standards, product-condition monitoring, and consistent evaluation of products supplied to retailers.

4.7.3 Packaging and Purchase Intention

Packaging did not have a statistically significant effect on purchase intention ($B = 0.060$; $p = 0.315$).

Although packaging may theoretically influence consumer perception through visual attractiveness, information, practicality, and product protection, the empirical evidence in this study does not support packaging as a significant individual determinant of purchase intention.

The PCA findings also suggest measurement complexity within the construct. Packaging indicators did not demonstrate the same level of explanatory strength as the strongest indicators of other constructs.

Therefore, PT Sari Rasa should maintain functional packaging standards without allocating disproportionate strategic resources toward packaging redesign solely for the purpose of increasing purchase intention. Packaging may nevertheless remain important for product protection, retailer requirements, and regulatory or sustainability considerations.

4.7.4 Promotion and Purchase Intention

The effect of promotion could not be statistically tested because the Promotion construct failed the validity, reliability, and PCA requirements. This is particularly relevant because promotion also received the lowest descriptive mean among the marketing factors, approximately 3.21.

However, the finding should be interpreted carefully. The study does not conclude that promotion has no effect on purchase intention. Instead, the available measurement instrument was insufficient to establish a valid empirical relationship.

Therefore, promotional activities remain a potential managerial area for PT Sari Rasa, but they should not be prioritized as the primary evidence-based determinant until the construct can be properly measured.

4.7.5 Lifestyle and Purchase Intention

Lifestyle did not demonstrate a statistically significant individual effect on purchase intention ($B = 0.016$; $p = 0.855$).

Although lifestyle is theoretically relevant to consumer behavior, the findings indicate that lifestyle differences did not significantly explain purchase intention in this sample. This suggests that traditional chips may function more as an accessible everyday snack than as a product strongly associated with a particular lifestyle identity.

Consequently, lifestyle may be more useful for communication segmentation than as the central basis for product positioning.

4.7.6 Product Availability and Purchase Intention

Product availability was the second strongest determinant of purchase intention ($B = 0.331$; $p < 0.001$). This finding is particularly important from a managerial perspective because PT Sari Rasa operates primarily as a distributor.

The strongest Product Availability indicator was A2, relating to the availability of different flavors, with a factor loading of 0.799. Therefore, availability should not be interpreted merely as physical presence in a supermarket. Consumers also associate availability with having sufficient choices.

This suggests that PT Sari Rasa should focus on:

- Expanding supermarket coverage
- Maintaining consistent stock
- Increasing product variety
- Improving shelf visibility
- Strengthening retailer relationships
- Collaborating with suppliers to provide additional flavors

The alignment between empirical importance and PT Sari Rasa's operational capabilities makes Product Availability one of the most actionable strategic factors identified by the study.

4.8 Integrated Findings

The results reveal a clear pattern. Consumers' purchase intention toward traditional chips is primarily influenced by functional and economic considerations. The three statistically significant determinants are:

- 13. Price — strongest determinant
- 14. Product Availability — second strongest determinant
- 15. Product Quality — significant supporting determinant

Packaging and Lifestyle were not statistically significant individually, while Promotion could not be tested because of measurement problems. The model nevertheless demonstrates strong explanatory ability, with an Adjusted R² of 82.0%.

The findings therefore suggest that consumers' purchase intention is driven more strongly by whether the product is reasonably priced, available, and perceived as good quality than by packaging aesthetics or lifestyle compatibility.

5. Marketing Strategy Implications for PT Sari Rasa

5.1 Strategic Priority

The empirical findings were integrated with descriptive analysis and PT Sari Rasa's operational position, following the priority-setting logic used in David's (2017) strategic-management framework.

Table 5. *Strategic Priority Matrix Integrating Descriptive and Regression Evidence*

Factor	Mean	Regression	Strategic Priority
Price	3.584	$\beta = 0.436$, significant	High
Product Availability	4.170	$\beta = 0.331$, significant	High
Product Quality	4.157	$\beta = 0.206$, significant	Medium
Lifestyle	3.850	Not significant	Low
Packaging	3.571	Not significant	Low
Promotion	3.213	Not tested	Re-examine

Note. Priority reflects the combination of statistical significance and PT Sari Rasa's operational control over each factor; not statistical weight alone.

Price receives particularly high strategic attention because it combines the strongest regression effect with a relatively low consumer evaluation. Product availability, in contrast, already receives a high consumer evaluation and is also statistically significant, making it a competitive strength that should be protected and expanded.

5.2 PESTEL Analysis

The external environment was assessed using PESTEL analysis, following the multi-dimensional structure proposed by Yüksel (2012).

Political

Government programs supporting MSME development, certification, and market access provide opportunities for PT Sari Rasa and its MSME suppliers.

Economic

Consumer price sensitivity and competition within the snack category create pressure on pricing. Competitive pricing therefore remains important, particularly because price was identified as the strongest purchase-intention determinant.

Social

Consumers continue to show familiarity with traditional and locally produced foods. This creates an opportunity to position traditional chips around authenticity, local identity, and Indonesian culinary heritage.

Technological

Digital platforms and online marketplaces provide opportunities to supplement conventional supermarket distribution and increase product visibility.

Environmental

Growing expectations for environmentally sustainable packaging create pressure for suppliers and distributors to consider packaging materials and sustainability requirements.

Legal

Food safety, BPOM registration, halal certification, and retailer requirements can influence supplier access and distribution continuity.

Together, these factors indicate that PT Sari Rasa operates in an environment with opportunities for market expansion but also increasing competitive, regulatory, pricing, and sustainability pressures.

5.3 SWOT Analysis

The internal and external strategic factors were organized using the SWOT framework consistent with David's (2017) strategic-management approach.

Strengths

- S1. Extensive distribution network across local supermarkets in Jakarta.
- S2. Established relationships with multiple MSME producers.
- S3. Operational flexibility in adjusting product assortment.
- S4. Distribution capability supporting products perceived positively in quality and availability.

Weaknesses

- W1. Limited control over product formulation, packaging, and product innovation.
- W2. Limited ability to conduct coordinated promotional activities.
- W3. Dependence on MSME suppliers for production capacity and consistency.
- W4. Limited corporate brand recognition.
- W5. Limited pricing flexibility because supplier pricing structures influence prices.

Opportunities

- O1. Government support for MSME development and certification.
- O2. Growing consumer interest in traditional and local products.

- O3. Expansion of digital platforms and marketplaces.
- O4. Consumer behavior supported by familiarity, accessibility, and recommendations.

Threats

- T1. High price sensitivity and intense price competition.
- T2. Competition from modern packaged snacks, imported products, and private labels.
- T3. Increasing sustainability expectations.
- T4. Increasing regulatory and certification requirements.

5.4 SWOT Strategy Formulation

The SWOT analysis generated four groups of strategies.

SO Strategies

- Expand distribution into additional local supermarkets and online marketplaces.
- Position traditional chips as authentic local products.
- Expand flavor variety in each outlet.
- Strengthen retailer collaboration through in-store sampling and shelf activation.

These strategies leverage PT Sari Rasa's distribution and supplier strengths while responding to opportunities in local-food demand and digital distribution.

ST Strategies

- Strengthen value-for-money communication.
- Maintain stock consistency and shelf visibility.
- Collaborate with suppliers on environmentally sustainable packaging.
- Assist MSME suppliers with BPOM and halal certification.

WO Strategies

- Develop joint marketing programs with supermarket partners and suppliers.
- Use digital platforms and social media to increase awareness.
- Diversify supplier partnerships.
- Build PT Sari Rasa's corporate identity through retailer collaborations and MSME or local-food events.

WT Strategies

- Periodically review prices against competing products.
- Establish supplier performance standards.
- Diversify sourcing across certified MSME producers.

- Monitor competitors, market trends, and retailer requirements.

5.5 Priority Marketing Strategy

The study combines four sources of evidence: Descriptive analysis → PCA → Regression → SWOT.

Descriptive analysis identifies current consumer perceptions. PCA identifies the most representative characteristics within each construct. Regression identifies which factors significantly influence purchase intention. SWOT then translates these findings into strategies that are compatible with PT Sari Rasa's organizational position.

Priority 1 — Price

Because price is the strongest determinant but receives a comparatively lower consumer evaluation, PT Sari Rasa should improve consumers' perception of value. The emphasis should be on:

- Competitive shelf pricing
- Periodic competitor price monitoring
- Supplier negotiation
- Value-for-money communication
- Avoiding unnecessary discount dependency

Priority 2 — Product Availability

Product availability represents the second strongest determinant and is particularly controllable by a distributor. The strategy should focus on:

- Wider supermarket coverage
- Consistent inventory
- Broader flavor assortment
- Stronger shelf placement
- Improved retailer collaboration
- Expansion into complementary digital channels

Priority 3 — Product Quality

Product quality should be maintained rather than treated as an urgent improvement area because consumer evaluations are already high. The emphasis should be on:

- Supplier quality standards
- Product-condition monitoring
- Consistency of taste and texture
- Supplier performance evaluation

The study therefore recommends SO as the primary strategic orientation, because it allows PT Sari Rasa to leverage its distribution capabilities and supplier relationships while capitalizing on opportunities in local products and expanding retail and digital channels.

5.6 Implementation Framework

The implementation approach can be structured into four stages.

Quarter 1: Establish the Foundation

- Conduct stock consistency audits
- Establish baseline outlet coverage
- Conduct shelf-level competitor price monitoring
- Review current assortment by outlet
- Begin supplier performance evaluation

Quarter 2: Strengthen Price and Assortment

- Conduct supplier price-positioning reviews
- Introduce value-for-money communication at shelf
- Expand product assortment
- Begin increasing outlet coverage

Quarter 3: Expand Distribution

- Continue supermarket expansion
- Negotiate improved shelf placement
- Continue competitor price monitoring
- Strengthen supplier diversification

Quarter 4: Extend Channels

- Develop digital marketplace listings
- Consolidate distribution improvements
- Strengthen retailer collaboration
- Gradually introduce more sustainable packaging initiatives with suppliers

The thesis implementation framework proposes, among other targets, a 20% increase in outlet coverage, a minimum of 20 chip variants per outlet, and a target stock-out rate below 5%, with progress evaluated using distribution records, stock reports, outlet audits, and repeated consumer surveys.

These targets should be treated as an implementation framework rather than a finalized operational budget, because internal financial information and complete organizational resource data were not available in the research.

6. Discussion

The findings provide several important implications for understanding consumer purchase intention toward traditional chips.

First, the dominance of price suggests that consumers remain attentive to the economic value of traditional snack products even when they have moderate-to-higher purchasing power. The result indicates that affordability and perceived value remain important decision criteria.

Second, product availability emerged as a particularly important factor. This finding is strategically significant because availability is closely connected to PT Sari Rasa's core role as a distributor. Unlike product formulation or packaging design, distribution coverage and inventory management are areas where the company can exert greater operational influence.

Third, product quality is statistically significant and highly rated. This suggests that quality should be treated as a hygiene factor to maintain consistently, rather than necessarily as the primary source of competitive differentiation.

Fourth, the non-significant result for packaging challenges the assumption that packaging automatically drives purchase intention in this product category. Packaging remains operationally important, but its contribution to purchase intention appears weaker than price, availability, and quality.

Fifth, lifestyle did not significantly influence purchase intention. This suggests that traditional chips in local supermarkets may be consumed across different consumer lifestyles rather than being strongly associated with one particular lifestyle segment.

Finally, promotion remains an unresolved research area rather than a rejected determinant. Because the promotion construct failed measurement testing, future research is needed before conclusions can be drawn about its actual relationship with purchase intention.

7. Theoretical Implications

This research contributes to consumer behavior and marketing literature by demonstrating that the determinants of purchase intention may vary according to product category and retail context.

The results provide empirical support for the relevance of marketing-mix and consumer-behavior perspectives, particularly for price, product quality, and product availability.

The findings also demonstrate the value of combining PCA and regression. PCA identifies the representative characteristics within each construct, while regression determines which constructs significantly explain purchase intention.

The study additionally illustrates that strategic implications should not be derived solely from statistical significance. A variable's managerial importance also depends on consumer evaluation and organizational control.

For example, Product Availability has both a significant relationship with purchase intention and a direct connection to PT Sari Rasa's distributor role. Consequently, it represents a particularly actionable strategic factor.

8. Managerial Implications

For PT Sari Rasa, the findings indicate that marketing resources should primarily support price perception and product availability.

The company should avoid interpreting the findings as a recommendation to simply reduce prices. Because PT Sari Rasa's pricing flexibility is constrained by supplier pricing, the more sustainable approach is to communicate value and maintain competitive shelf positioning.

Product availability represents an especially attractive strategic opportunity. PT Sari Rasa can directly influence outlet coverage, assortment, stock consistency, retailer relationships, and shelf visibility.

Product quality should be maintained through supplier standards and monitoring.

Packaging should meet functional, retailer, and regulatory requirements but should not receive disproportionate investment solely for increasing purchase intention.

Promotion should be treated as an area requiring further measurement rather than as a proven determinant.

Lifestyle may be incorporated into communication segmentation where appropriate, but should not become the primary positioning variable based on the current evidence.

9. Limitations and Future Research

Several limitations should be considered.

First, the research examined consumers of traditional chips available in local supermarkets rather than consumers specifically evaluating PT Sari Rasa's products. Consequently, the empirical results represent market-level consumer perceptions and should not be interpreted directly as measures of PT Sari Rasa's organizational performance.

Second, promotion could not be included in the regression model because its measurement instrument did not meet the required validity, reliability, and factor analysis criteria. Therefore, no conclusion can be made about whether promotion affects purchase intention.

Third, the packaging construct demonstrated relatively weak measurement characteristics and may represent multiple dimensions. Future research could separate functional, informational, and visual packaging characteristics into distinct constructs.

Fourth, the presence of heteroscedasticity for Price and Lifestyle means that regression significance should be interpreted cautiously.

Fifth, the sample consisted of 100 respondents selected through purposive sampling in Jakarta. Therefore, the findings should not automatically be generalized to all Indonesian consumers.

Future research should therefore:

1. Develop and validate a new promotion measurement instrument.
2. Separate packaging into more specific dimensions.

3. Examine additional determinants of purchase intention.
4. Study consumers specifically purchasing PT Sari Rasa-distributed products.
5. Consider larger and geographically broader samples.
6. Apply more advanced strategic evaluation methods such as IFE, EFE, QSPM, or expert-based multi-criteria evaluation when assessing implementation feasibility.

The original study specifically notes that the strategic priority weights should not be interpreted as a complete measure of strategy feasibility because costs, organizational capabilities, resources, risks, and potential returns were not evaluated.

10. Conclusion

This study examined the factors influencing consumer purchase intention toward traditional chips sold in local supermarkets in Jakarta and translated the findings into marketing strategy implications for PT Sari Rasa.

Based on data from 100 respondents, Price, Product Quality, and Product Availability were found to have positive and statistically significant effects on purchase intention. Price was the strongest determinant, followed by Product Availability and Product Quality.

Packaging and Lifestyle did not demonstrate statistically significant individual effects. Promotion could not be evaluated because the construct failed to satisfy the required measurement criteria.

The regression model was statistically significant and explained 82.0% of the variation in purchase intention based on the adjusted R^2 .

The findings indicate that consumer purchase intention toward traditional chips is primarily associated with functional and economic considerations: whether consumers perceive the product as reasonably priced, whether it is accessible and available in sufficient variety, and whether its quality meets expectations.

For PT Sari Rasa, the findings provide a particularly strong strategic fit because two of the most important determinants — price perception and product availability — are directly relevant to the company's distributor role.

Accordingly, the recommended strategy emphasizes:

Value for Money + Wider Availability + Consistent Quality

The primary strategic orientation is to leverage PT Sari Rasa's distribution network and supplier relationships to expand product availability while strengthening value-for-money positioning. Supporting initiatives should focus on supplier quality, promotion, packaging, sustainability, and regulatory compliance.

Overall, the study demonstrates how consumer research can be translated into evidence-based marketing strategy by integrating descriptive analysis, PCA, regression, PESTEL, and SWOT rather than relying solely on managerial assumptions.
